

*Dr Andrew Jerimijenko sent the following:*

I think if you can add into the draft at some point, that  
"Recent research suggests further review into the role of TRP A1 receptors in multiple chemical sensitivity and the role of receptor blocking which may be used in its treatment is warranted. "

David,

I have read your draft version of Multiple Chemical Sensitivity and it is very good.  
I would like to add a small bit into the immunoregulation section about TRPA1 and V1 which seems to play a role in chemical sensitivity.

Dr Peter Smith an allergist from Qld has been doing some research in this area. It may be worth your while talking to him.

He is very keen to get this information into the research of multiple chemical sensitivity and has had good success by treating these receptors in MCS patients. His phone is (07) 5591 5744

He was quite excited by his latest research, so it would be worthwhile including this research in your draft report.

All the best

Andrew
